Service Guide Coverage

This Service Guide provides you with all technical information relating to the BASIC CONFIGURATION decided for Acer's "global" product offering. To better fit local market requirements and enhance product competitiveness, your regional office MAY have decided to extend the functionality of a machine (e.g. add-on card, modem, or extra memory capability). These LOCALIZED FEATURES will NOT be covered in this generic service guide. In such cases, please contact your regional offices or the responsible personnel/channel to provide you with further technical details.

FRU Information

Please note WHEN ORDERING FRU PARTS, that you should check the most up-to-date information available on your regional web or channel. If, for whatever reason, a part number change is made, it will not be noted in the printed Service Guide. For ACER-AUTHORIZED SERVICE PROVIDERS, your Acer office may have a DIFFERENT part number code to those given in the FRU list of this printed Service Guide. You MUST use the list provided by your regional Acer office to order FRU parts for repair and service of customer machines.

Chapter 1

System Tour

Features

Below is a brief summary of the computer's many feature:

NOTE: The features listed in this section is for your reference only. The exact configuration of the system depends on the model purchased.

Operating System

- Microsoft Windows Windows 7 Home Premium x64 x86
- Microsoft Windows Windows 7 Home Basic x64 x86
- Linpus Linux x-Window mode
- Free Dos

Processor

- Socket Type: IntelR Socket T LGA 775 pin
- Socket Quantity: 1
- Processor Type:
  - CPUs which compliant with Intel FSB 800/1066/1333 MHz CPUs
- FMB
  - 95W FMB
  - VRD 11.1

Chipset

- PCH:Intel G43 + ICH10R
- Design Criteria:
  - Should meet Intel G45/G43+ICH10R platform design guide
- Super I/O: ITE8720
  - Should support Intel ASFC
  - Should support Intel PECI
  - Should support SST signal output

PCB

- Max. 244 mm x 244 mm, MicroATX

Memory subsystem

- Socket Type: DDR III connector
  - Socket Quantity: 4
  - Channel A: slot 0, 1; Channel B: slot 2, 3
  - Different colors for slot 0/2 and slot 1/3
- Dual channel support
- Support Intel Flex Memory Mode
- Capacity support:

Downloaded from www.Manualslib.com manuals search engine

- 1GB / 2GB DDR III 800/1066/1333 Un-buffered Non-ECC DIMM support
- 1GB to 8GB Max memory support

- Design Criteria:
  - Should meet Intel G45/G43 Express Chipset platform design guide
  - Dual channel should be enabled always when plug-in 2 same memory size DDRIII memory module

Hard disk

- Support up to two SATA ports
- 3.5", 25.4mm
- Capacity and models are listed on FRU list

Optical disk

- Support two SATA 5.25" standard ODD
- Support DVD-ROM, DVD-SuperMulti, BD-combo, BD-rewrite
- Maximum ODD depth to 185mm with bezel
- Models are listed on FRU list

On-Board Graphic solution

- Intel G45/G43 on die graphic solution
  - DVMT 5.0 technology support
  - Enhanced 3D and Clear Video technology support
  - 1 D-sub VGA port on rear
  - 1 HDMI port on rear
  - Dual View function support

Serial ATA controller

- Slot Type: SATA slot
- Six SATA ports:6
- Storage Type support:
  - HDD/CD-ROM/CD-RW/DVD-ROM/DVD-RW/DVD+RW/DVD Dual/DVD SuperMultiPlus/Blu-Ray ODD

Audio

- Chip:HD audio codec ALC888S HD codec 7.1
- Connectors support:
  - Rear 6 jack follow HD audio definition
  - Audio jacks color coding: should meet Microsoft Windows Logo Program Device Requirements: Audio-0002
  - 2 S/PDIF-out header (1*4) for ALC888S-VC sku
  - 1 front panel audio header (2*5)
  - S/N ration: 90dB at rear output jack

LAN

- MAC Controller:ICH10R
- PHY:Intel Boazman 82567V PCI-E Giga LAN

Downloaded from www.Manualslib.com manuals search engine

USB ports

- Controller: Intel ICH10R
- Ports Quantity: 12
  - 4 back panel ports
  - On-board: Four 2*5 headers(8 ports)
  - 4 ports for front daughter board
- Connector Pin: standard Intel FPIO pin definition
- Data transfer rate support: USB 2.0/1.1

Extension slot

- PCI Express Slot Type: x16
  - PCI Express x16 Slot Quantity: 1
- PCI Express Slot Type: x1
  - PCI Express x1 Slot Quantity: 1
- PCI Slot Quantity: 2

Total I/O ports

- Rear I/O connectors:
  - 1 PS/2 Keyboard port
  - 1 PS/2 Mouse port
  - 1 D-Sub VGA port
  - 1 HDMI VGA port
  - 1 RJ45 LAN port
  - 1 1394 port
  - 4 USB ports
  - 7.1 channel phone jack
- On-board connectors:
  - 1 LGA 775 CPU socket
  - 4 DDRIII memory sockets
  - 1 PCI Express x16 slot
  - 1 PCI Express x 1 slot
  - 2 PCI slot
  - 6 SATA2 connectors
  - Four 2*5 pin Intel FPIO specification USB pin connectors (follow Intel FPIO standard Specification)
  - One 2*5 pin Intel FPIO spec. Microphone In/ Headphone Out pin connectors
  - One 4 pin CPU Fan connector
  - One 3 pin System FAN connector with linear circuit
  - One 24pin + 4pin ATX interface PS3/PS2 SPS connector
  - One 2*7 pin front panel IO header
  - 1 Jumper for clear CMOS
  - One 2*5pin Front Audio header
  - 1 SPDIF out header x2
  - One 2*5pin 1394 header
  - 1 on board buzzer
  - 2 reserved 2pin GPIO connector
  - 1 3pin ME enable/disable connector (with 1 jumper)

Downloaded from www.Manualslib.com manuals search engine

System BIOS

- Type:
  - Use SPI Flash
  - Size:2MB
- Kernel:AMI Kernel with Acer skin

Power supply

- 500W/300W/250W in stable mode (Acer Assign System Power Unit)
- Design for Intel G43 series chipset compatible system
- Voltage design should be covered +5V, +3.3V, +12V, +5VSB, -12V (attention to 12V output capability)
- Demand for both PFC/Non-PFC solutions (two different quotations are needed)
- Minimum 4 Serial ATA power connector solution should be included (by default)
- Minimum 3 big 4-pin power connector included
- Minimum 1 small 4-pin power connector included
- PFC version will not provide switch selector for 115/230V AC input but it should be universal for Europe and China
- Non-PFC version should provide switch selector for 115/230V AC input and universal for worldwide
- PS2 style
- EupLot6 support

Power Management Function(ACPI support function)

Device Standby Mode

- Independent power management timer for hard disk drive devices(0-15 minutes,time step=1minute).
- Hard Disk drive goes into Standby mode(for ATA standard interface).
- Disable V-sync to control the VESA DPMS monitor.
- Resume method:device activated (keyboard for DOS, keyboard &mouse for Windows.
- Resume recovery time 3-5sec

Global Standby Mode

- Global power management timer(2-120minutes,time step=10minute).
- Hard disk drive goes into Standby mode(for ATA standard interface).
- Disable H-sync and V-sync signals to control the VESA DPMS monitor.
- Resume method: Resume to original state by pushing external switch Button,modem ring in,keyboard an mouse for APM mode.
- Resume recovery time :7-10sec

Suspend Mode

- Independent power management timer(2-120minutes,time step=10minute)or pushing extern switch button.
- CPU goes into SMM
- CPU asserts STPCLK# and goes into the Stop Grant State.
- LED on panel turns amber colour.
- Hard disk drive goes into SLEEP mode (for ATA standard interface).
- Disable H-sync and V-sync signals to control the VESA DPMS monitor.
- Ultra I/O and VGA chip go into power saving mode.
- Resume method: Resume to original state by pushing external switch Button,modem ring in,keyboard an mouse for APM mode
- Return to original state by pushing external switch button,modem ring in and USB keyboard for ACPI mode.

ACPI

- ACPI specification 1.0b
- S0,S1,S2 and S5 sleep state support.
- On board device power management support.
- On board device configuration support.

System Utilities

CMOS Setup Utility

CMOS setup is a hardware configuration program built into the system ROM, called the complementary metal-oxide semiconductor (CMOS) Setup Utility. Since most systems are already properly configured and optimized, there is no need to run this utility. You will need to run this utility under the following conditions.

- When changing the system configuration settings
- When redefining the communication ports to prevent any conflicts
- When modifying the power management configuration
- When changing the password or making other changes to the security setup
- When a configuration error is detected by the system and you are prompted ("Run Setup" message) to make changes to the CMOS setup

NOTE: If you repeatedly receive Run Setup messages, the battery may be bad. In this case, the system cannot retain configuration values in CMOS. Ask a qualified technician for assistance.

CMOS setup loads the configuration values in a battery-backed nonvolatile memory called CMOS RAM. This memory area is not part of the system RAM which allows configuration data to be retained when power is turned off.

Before you run the *CMOS* Setup Utility, make sure that you have saved all open files. The system reboots immediately after you close the Setup.

NOTE: *CMOS* Setup Utility will be simply referred to as “BIOS”, "Setup", or "Setup utility" in this guide.

The screenshots used in this guide display default system values. These values may not be the same those found in your system.

Downloaded from www.Manualslib.com manuals search engine

Entering CMOS setup

1. Turn on the server and the monitor.

   If the server is already turned on, close all open applications, then restart the server.

2. During POST, press **Delete**.

   If you fail to press **Delete** before POST is completed, you will need to restart the server.

   The Setup Main menu will be displayed showing the Setup's menu bar. Use the left and right arrow keys to move between selections on the menu bar.

Navigating Through the Setup Utility

Use the following keys to move around the Setup utility.

- **Left** and **Right** arrow keys – Move between selections on the menu bar.
- **Up** and **Down** arrow keys – Move the cursor to the field you want.
- **PgUp** and **PgDn keys** – Move the cursor to the previous and next page of a multiple page menu.
- **Home** – Move the cursor to the first page of a multiple page menu.
- **End** – Move the cursor to the last page of a multiple page menu.
- **+** and **-** keys – Select a value for the currently selected field (only if it is user-configurable). Press these keys repeatedly to display each possible entry, or the **Enter** key to choose from a pop-up menu.

NOTE: Grayed-out fields are not user-configurable.

- **Enter** key – Display a submenu screen.

NOTE: Availability of submenu screen is indicated by a (>).

- **Esc** – If you press this key:
  - On one of the primary menu screens, the Exit menu displays.
  - On a submenu screen, the previous screen displays.
  - When you are making selections from a pop-up menu, closes the pop-up without making a selection.
- **F1** – Display the General Help panel.
- **F6** – Press to load optimized default system values.
- **F7** – Press to load fail-safe default system values.
- **F10** – Save changes made the Setup and close the utility.

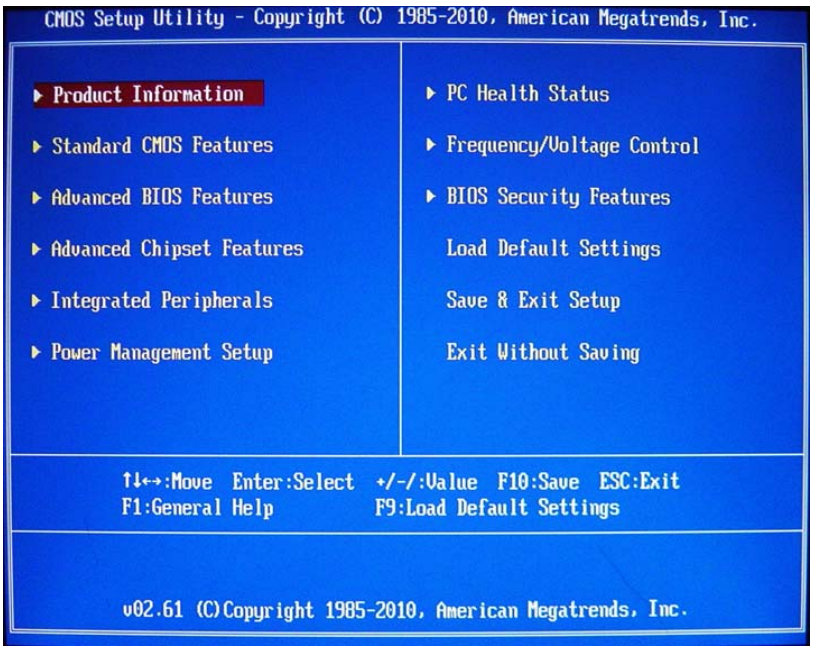
Setup Utility Menus



The Setup Main menu includes the following main setup categories.

Parameter	Description
Product Information	This page shows the relevant information of the main board
Standard CMOS Features	This setup page includes all the items in standard compatible BIOS
Advanced BIOS Features	This setup page includes all the items of Award special enhanced features
Advanced Chipset Features	This setup page includes all advanced chipset features
Integrated Peripherals	This setup page includes all onboard peripherals
Power Management Setup	This setup page includes all the items of Green function features
PC Health Status	This setup page is the System auto detect Temperature, voltage, and fan speed
Frequency/Voltage Control	This setup page is the System Frequency setup
BIOS Security Features	Change, set or disable password. It allows you to limit access to the System
Load Default Setting	Load Default Setting indicates the value of the system parameters which the system would be in best performance configuration
Save & Exit Setup	Save CMOS value settings to CMOS and exit setup
Exit Without Saving	Abandon all CMOS value changes and exit setup

In the descriptive table following each of the menu screenshots, settings in **boldface** are the default and suggested settings.

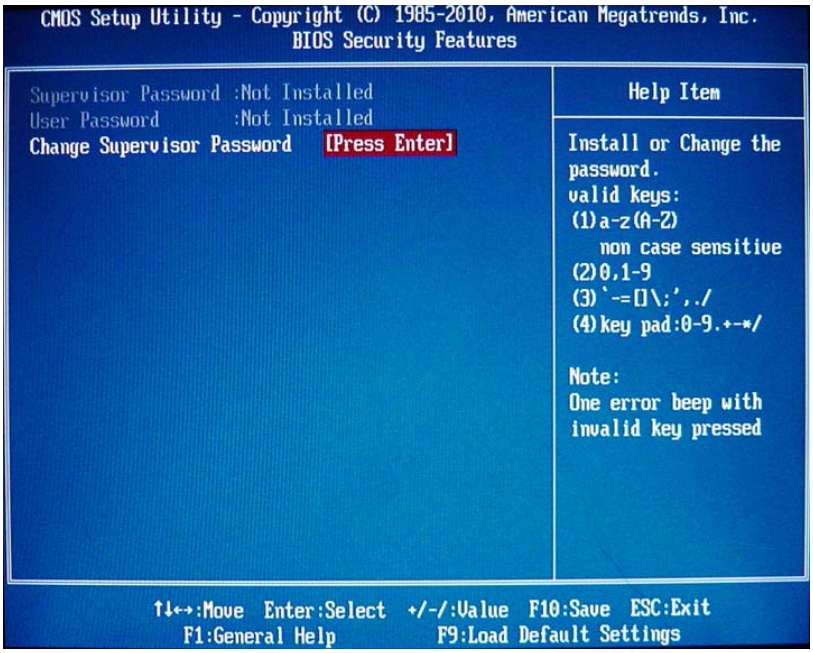
BIOS Security Features



Parameter	Description
Supervisor Password	Indicates the status of the supervisor password.
User Password	Indicates the status of the user password.
Change Supervisor Password	Supervisor password prevents unauthorized access to the BIOS Setup Utility. Press **Enter** to change the Supervisor password.

Setting a supervisor password

1. Use the up/down arrow keys to select Change Supervisor Password menu then press **Enter**.

   A password box will appear.
2. Type a password then press **Enter**.

   The password may consist up to six alphanumeric characters (A-Z, a-z, 0-9)
3. Retype the password to verify the first entry then press **Enter** again.
4. Press **F10**.
5. Select **Yes** to save the new password and close the Setup Utility.

Changing the supervisor password

1. Use the up/down arrow keys to select Change Supervisor Password menu then press **Enter**.
2. Type the original password then press **Enter**.
3. Type a new password then press **Enter**.
4. Retype the password to verify the first entry then press **Enter** again.
5. Press **F10**.
6. Select **Yes** to save the new password and close the Setup Utility.

Removing a supervisor password

1. Use the up/down arrow keys to select Change Supervisor Password menu then press **Enter**.
2. Enter the current password then press **Enter**.
3. Press **Enter** twice without entering anything in the password fields.

Load Default Settings

The Load Default Settings menu allows you to load the default settings for all BIOS setup parameters. Setup defaults are quite demanding in terms of resources consumption. If you are using low-speed memory chips or other kinds of low-performance components and you choose to load these settings, the system might not function properly.

Chapter 3

System Disassembly

This chapter contains step-by-step procedures on how to disassemble the desktop computer for maintenance and troubleshooting.

Disassembly Requirements

To disassemble the computer, you need the following tools:

- Wrist grounding strap and conductive mat for preventing electrostatic discharge
- Flat-blade screwdriver
- Philips screwdriver
- Hex screwdriver
- Plastic flat-blade screwdriver
- Plastic tweezers

NOTE: The screws for the different components vary in size. During the disassembly process, group the screws with the corresponding components to avoid mismatch when putting back the components.

Downloaded from www.Manualslib.com manuals search engine

Pre-disassembly Procedure

Before proceeding with the disassembly procedure, perform the steps listed below:

1. Turn off the system and all the peripherals connected to it.
2. Unplug the power cord from the power outlets.
3. Unplug the power cord from the system.
4. Unplug all peripheral cables from the system.
5. Place the system unit on a flat, stable surface.

Downloaded from www.Manualslib.com manuals search engine

Removing the Side Panel

1. Remove the two screws located on the rear edge of the side panel.

2. Slide the side panel toward the back of the chassis until the tabs on the cover disengage with the slots on the chassis.
3. Lift the side panel away from the server and put it aside for reinstallation later.

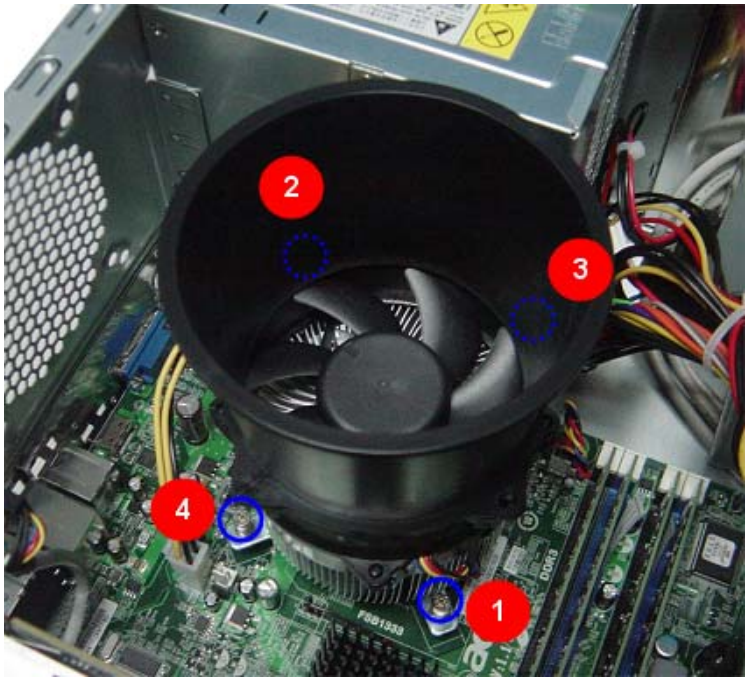
Removing the Heat Sink Fan Assembly

WARNING: The heat sink becomes very hot when the system is on. NEVER touch the heat sink with any metal or with your hands.

1. Use a long-nosed screwdriver to loosen the four screws on the heat sink, in the order as shown below.



2. Lift the heat sink fan assembly away from the mainboard.

Downloaded from www.Manualslib.com manuals search engine

3. Lay down the heat sink fan assembly, in an upright position, on top of the optical drive, as shown below, then disconnect the fan cable from the mainboard.

4. Remove the heat sink fan assembly from the chassis then lay it down in an upright position—with the thermal patch facing upward. Do not let the thermal patch on the heat sink fan assembly touch the work surface.
5. Use an alcohol pad to wipe off the thermal grease from both the heat sink and the processor.

Downloaded from www.Manualslib.com manuals search engine

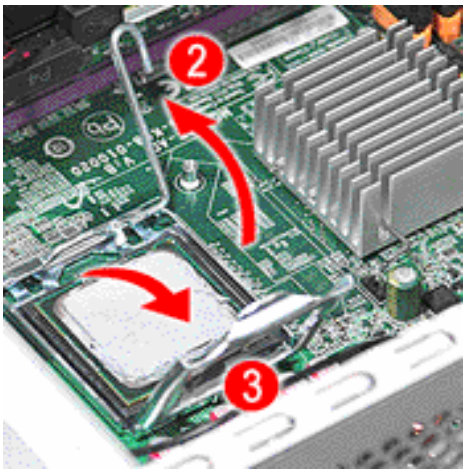
Removing the Processor

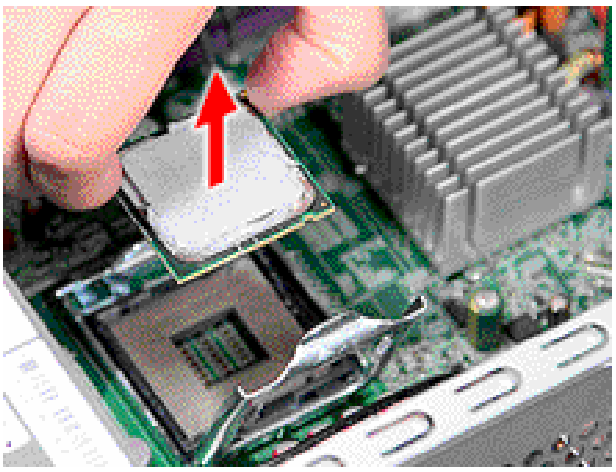
IMPORTANT: Before removing a processor from the mainboard, make sure to create a backup file of all important data.

WARNING: The processor becomes very hot when the system is on. Allow it to cool off first before handling.

1. Release the load lever (1).

2. Pull the load lever to the fully open, upright position (2) and lift the load plate (3).
3. Pull out the processor from the socket.





IMPORTANT: If you are going to install a new processor, note the arrow on the corner to make sure the processor is properly oriented over the socket.

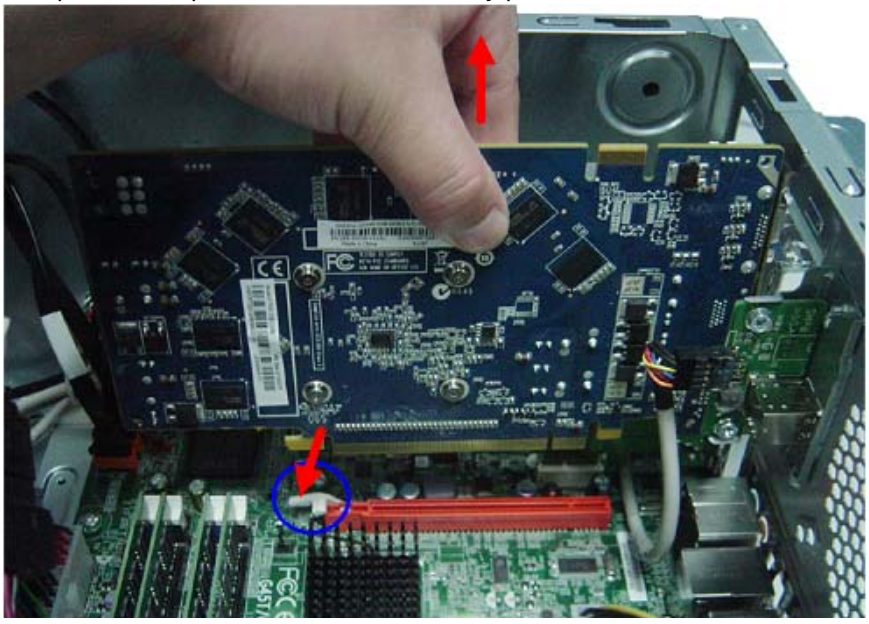
Removing the VGA Card

1. Remove the three screws that secures the card to the chassis.

2. Releasing PCI Latch.

3. Use a figer to press the clip,and the same time Gently pull the card to remove it from the mainboard.



Downloaded from www.Manualslib.com manuals search engine

Removing the TV Card

1. Gently pull the TV card to remove it from the mainboard.

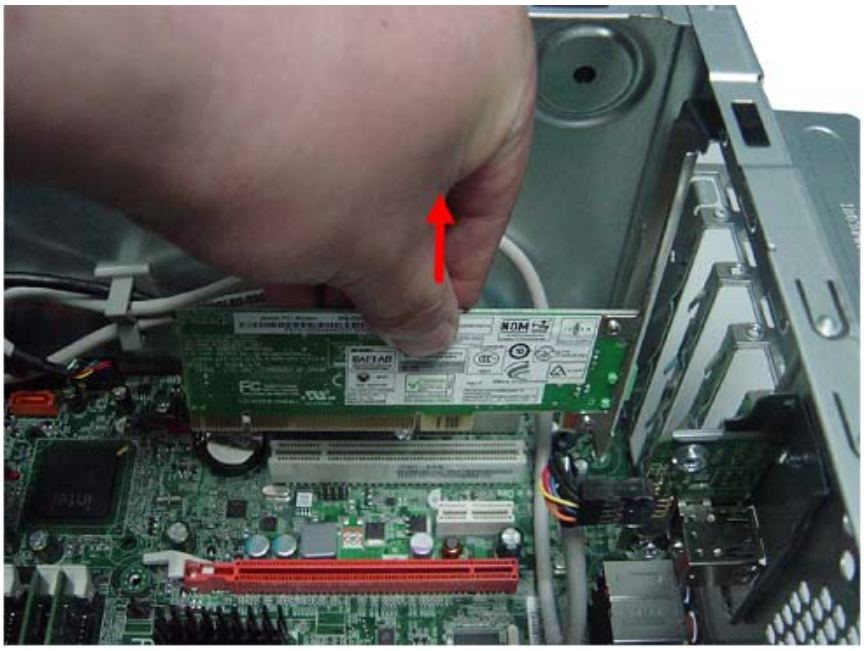
Removing the Mode Card

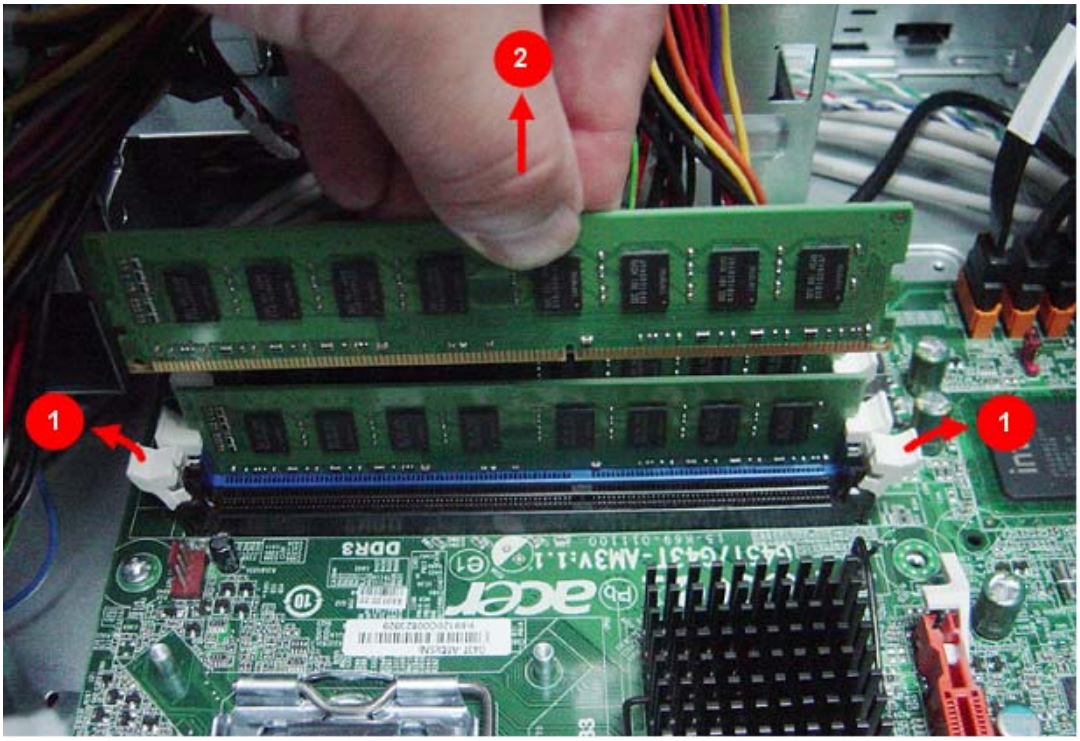
1. Gently pull the Mode card to remove it from the mainboard.



Downloaded from www.Manualslib.com manuals search engine

Removing the Memory Modules

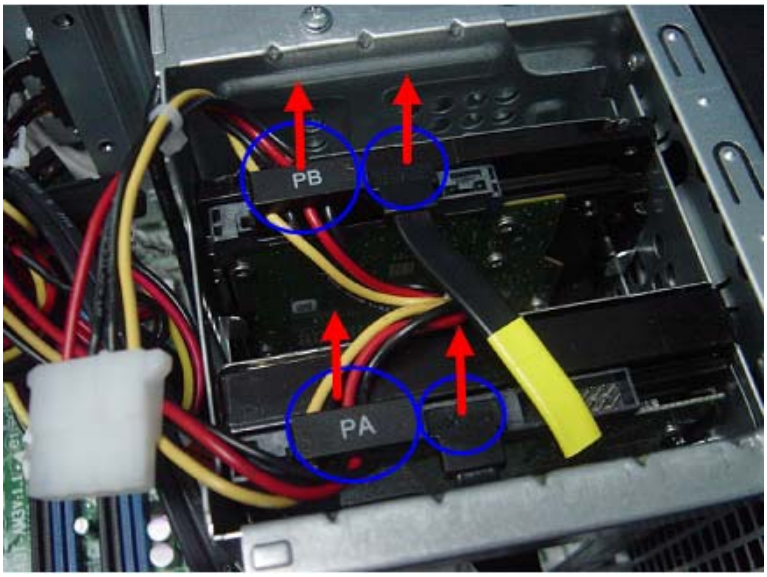
1. Press the holding clips on both sides of the DIMM slot outward to release the DIMM (1).
2. Gently pull the DIMM upward to pull it away from the chassis (2).



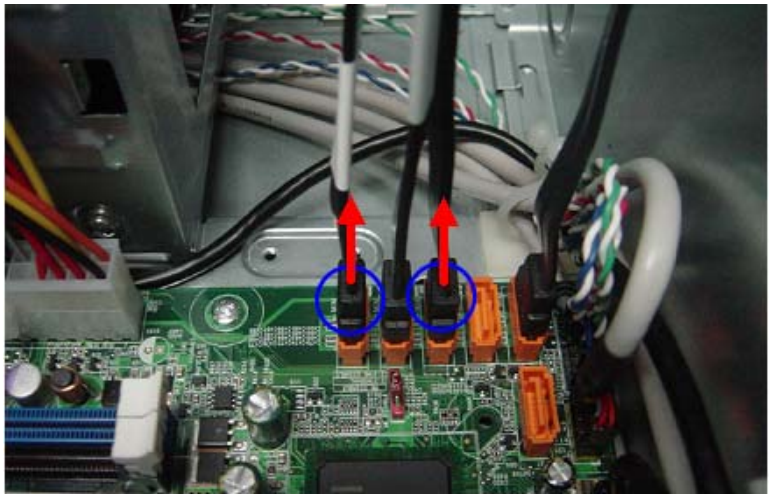
Downloaded from www.Manualslib.com manuals search engine

Removing the Hard Disk Drive

1. Disconnect the data and power cables from the rear of the hard drive.



2. Disconnect the other end of the data cable from the mainboard.

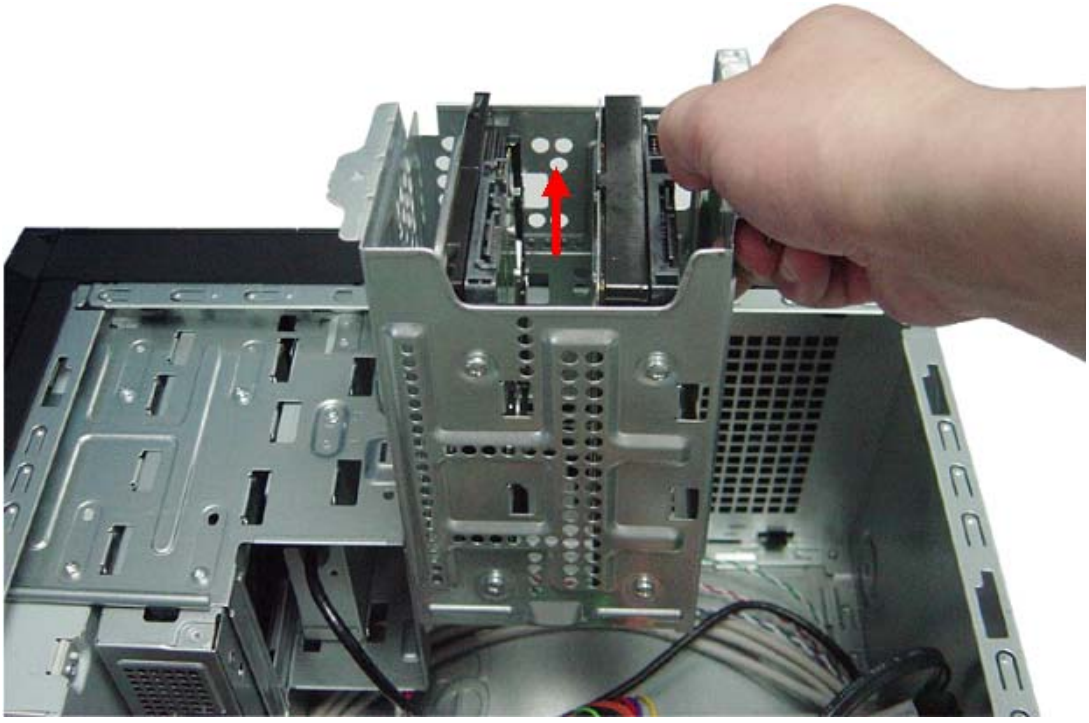


3. Remove the HDD bracket

   a. Remove the screw that secures the chassis to the HDD bracket.

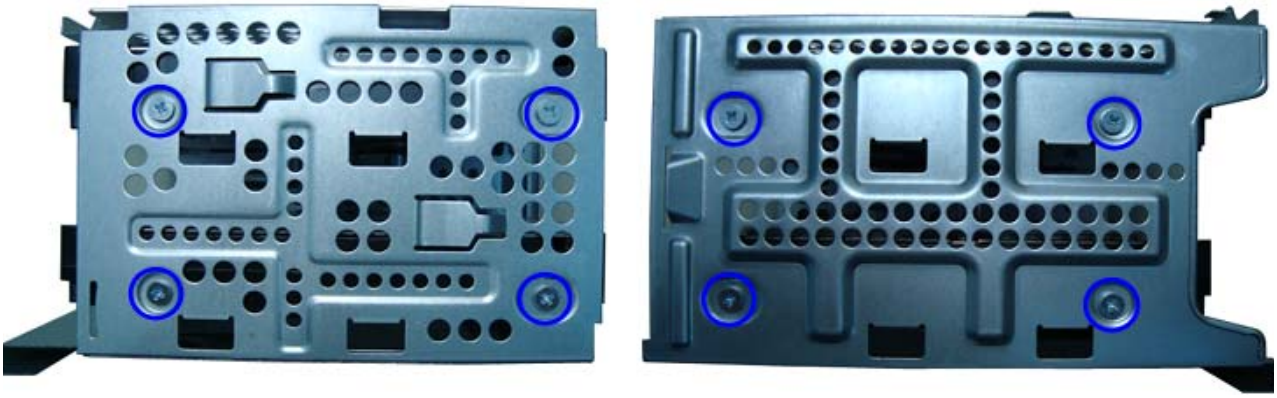
Downloaded from www.Manualslib.com manuals search engine

b. Lift the bracket up and turn it over.



4. Remove the HDD module

a. Remove the eight screws secure the HDD module to the HDD bracket.



b. Slide the HDD out of the bracket.

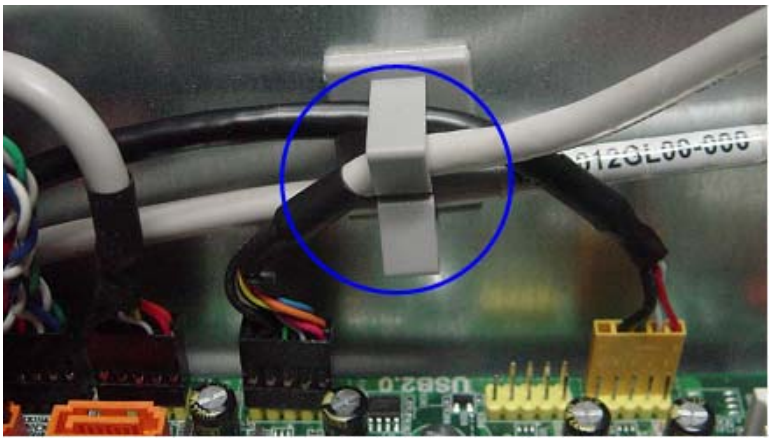
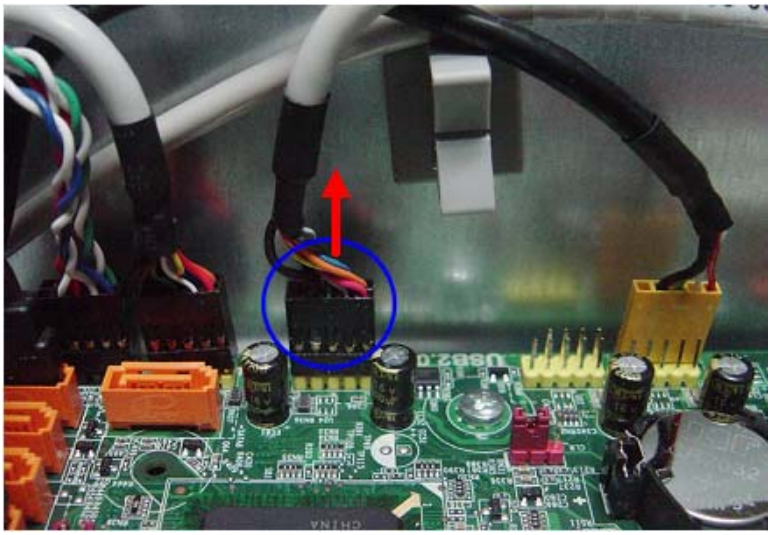
Removing the USB Board of Rear Panel

1. Release these cable from Cable clip.



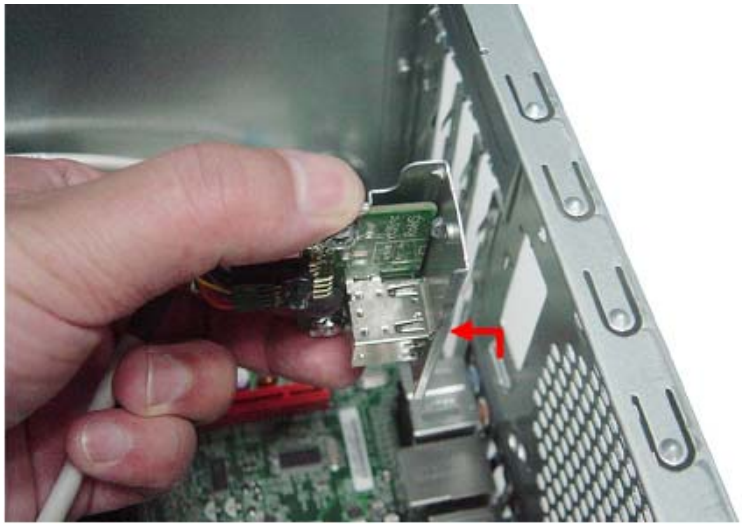
2. Disconnector the USB cable from the motherboard.



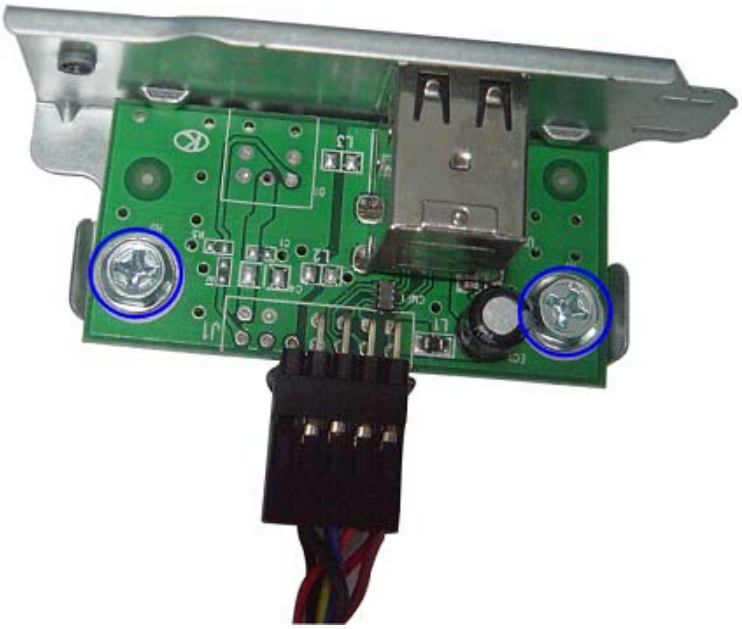
3. Remove the screw that secures the USB board bracket to the chassis.

Downloaded from www.Manualslib.com manuals search engine

4. Pull the USB board up and lift up from the chassis.



5. Remove the two screws that secure the USB board to the bracket.



6. Pull the USB board out of the bracket.

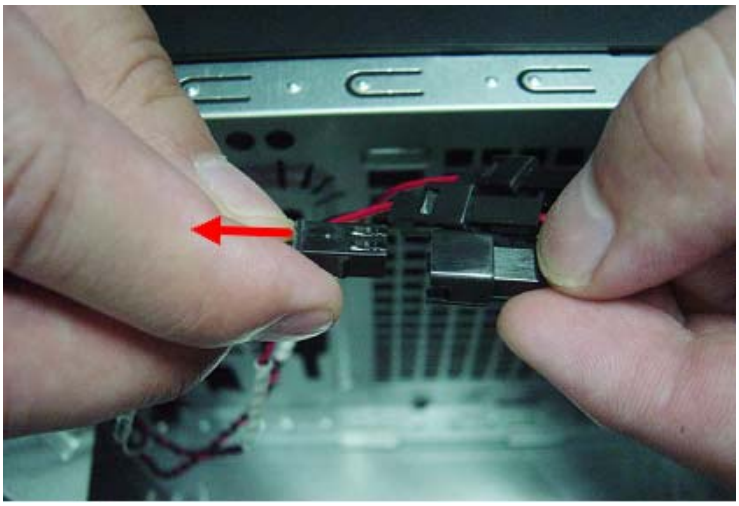
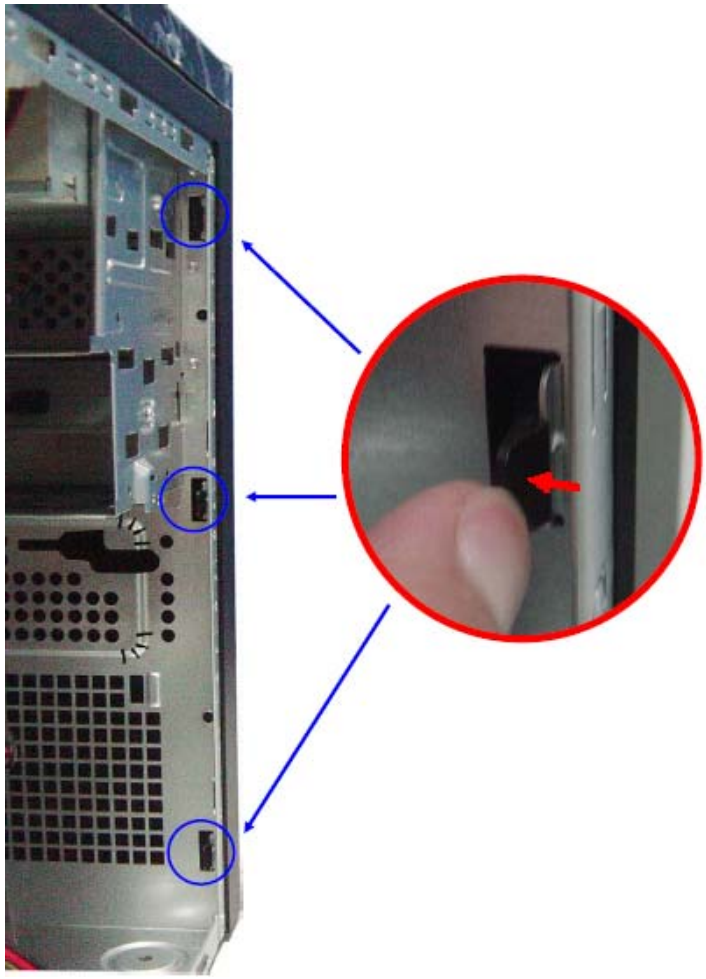
Removing the Front Bezel

1. Disconnect the LED cable.

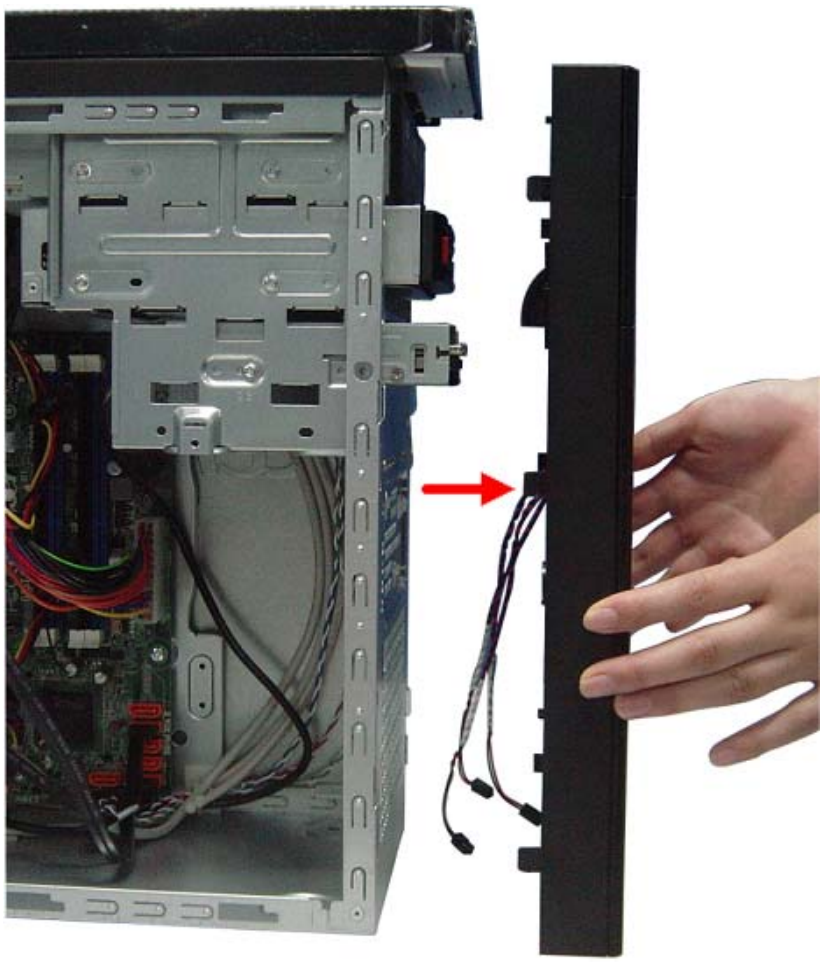


2. Release the front bezel retention tabs from the chassis interior.



Downloaded from www.Manualslib.com manuals search engine

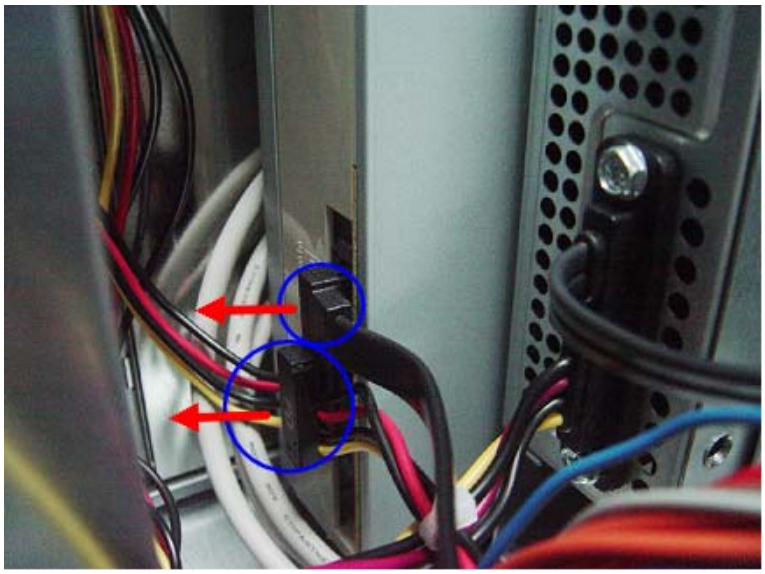
3. Pull the bezel away from the chassis.



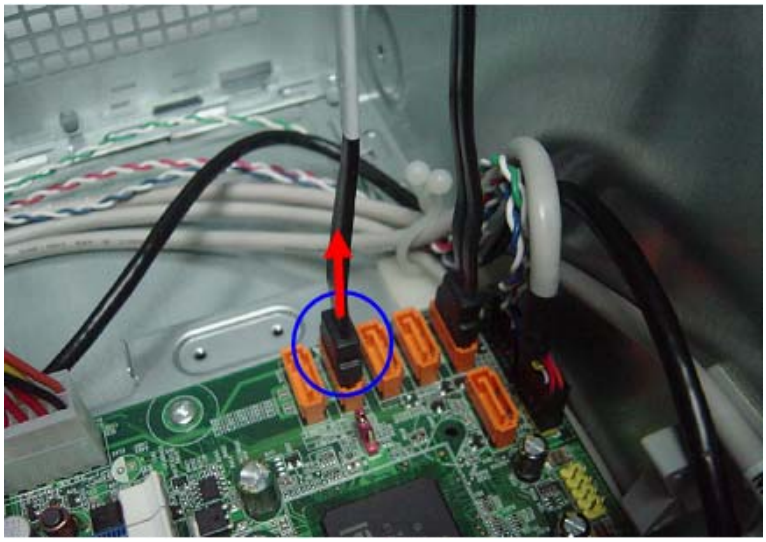
Downloaded from www.Manualslib.com manuals search engine

Removing the Optical Drive

1. Disconnect the data and power cables from the rear of the optical drive.



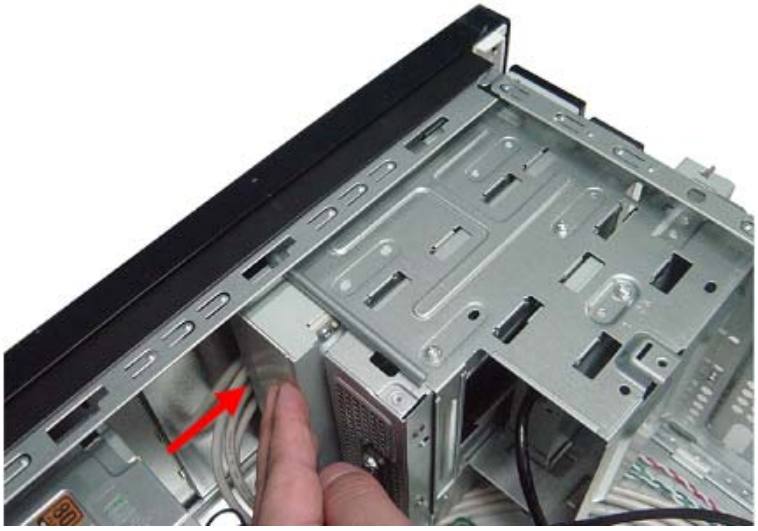
2. Disconnect the other end of the data cable from the mainboard.



3. Remove the two screws from the optical drive.

Downloaded from www.Manualslib.com manuals search engine

4. Pull the drive out of the drive bay.



NOTE: If the bay load to be optical drive,disassembly method is the same with master optical drive.

If the bay load to be removable HDD,please refer to next page “Removing the Removable HDD”disassembly method.

Removing the Removable HDD

1. Gently push the drive block key rightward,then open the door.

2. Slide the removable HDD tray out of the removable HDD bracket.

Downloaded from www.Manualslib.com manuals search engine

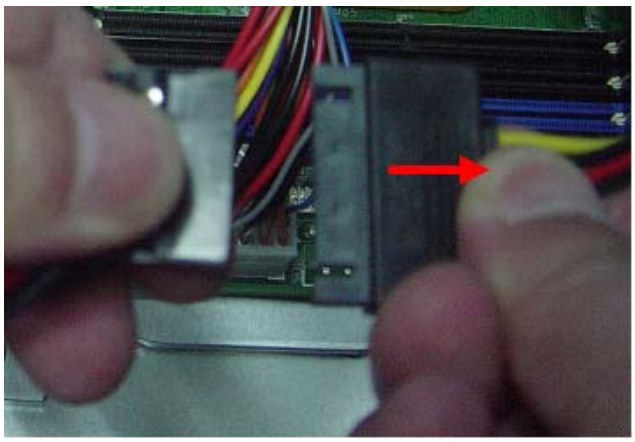
3. Remove the HDD module

   a. Use a hand to open out the removable HDD tray until the hook of HDD bracket away from the HDD screw bore. then use other hand to take out the HDD module.

4. Remove the removable HDD bracket.

   a. Disconnect the data cable from the mainboard.

   b. Disconnect the power cable.



Downloaded from www.Manualslib.com manuals search engine

c. Remove the two screws that secures the removable HDD bracket to the chassis.

d. Remove the removable HDD out of the chassis.

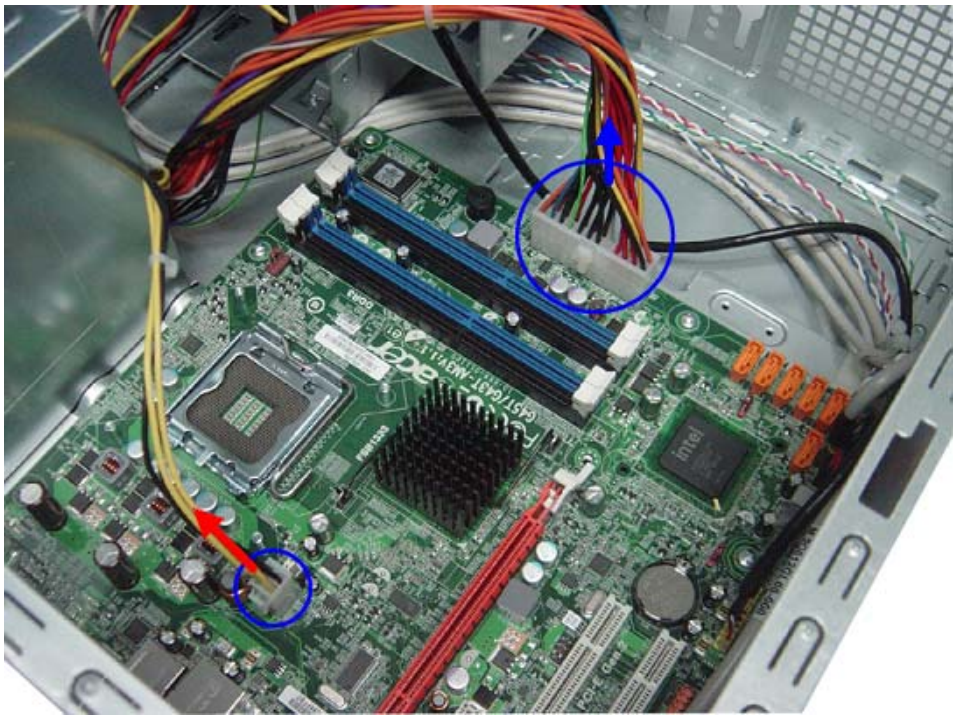
Removing the Power Supply

1. Disconnect the 24-pin and 4-pin power supply cables from the mainboard.



2. Remove the four screw that secures the power supply to the chassis.

Downloaded from www.Manualslib.com manuals search engine

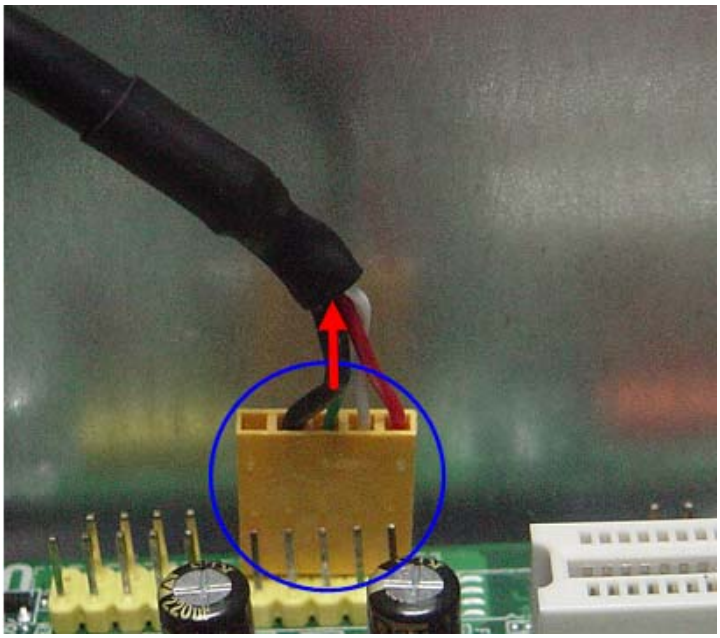
3. Lift the power supply module out of the chassis.

Downloaded from www.Manualslib.com manuals search engine

Removing the Card Reader

1. Open the cable retention clip.

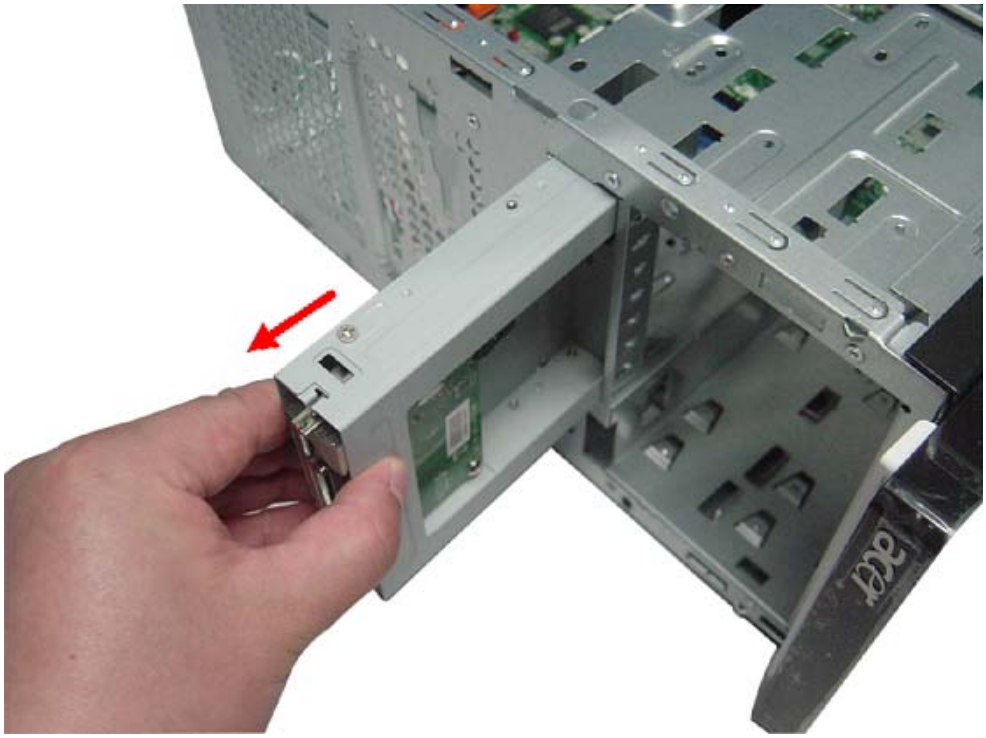
2. Disconnector the card reader cable from the motherboard.



3. Remove the screw that secures the card reader to the chassis.

Downloaded from www.Manualslib.com manuals search engine

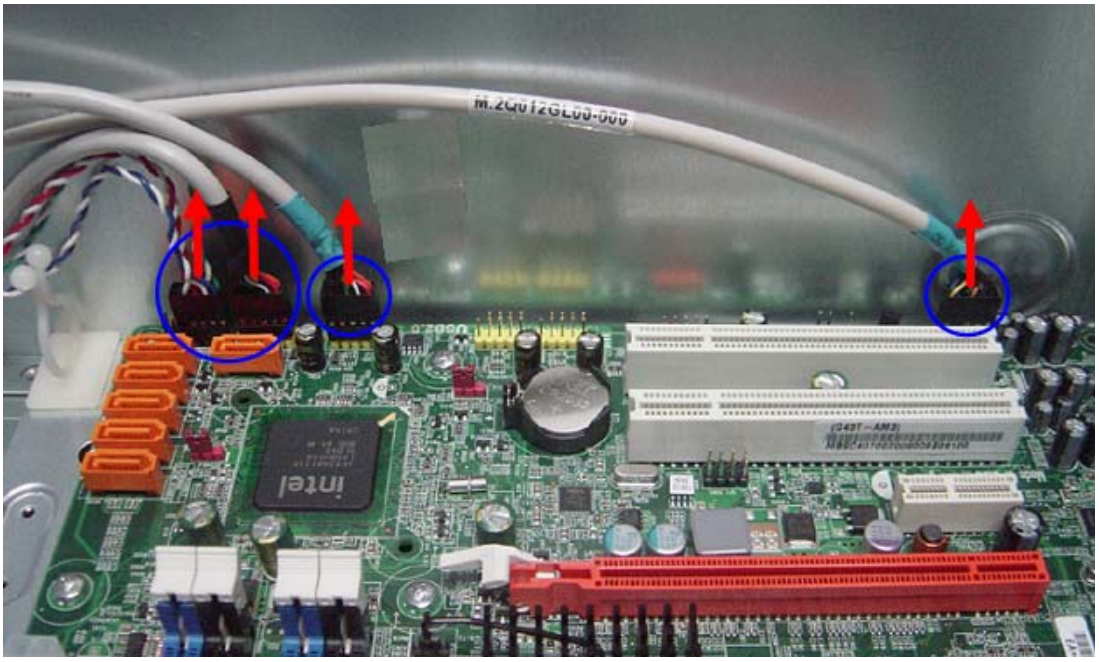
4. Pull the card reader out of chassis.



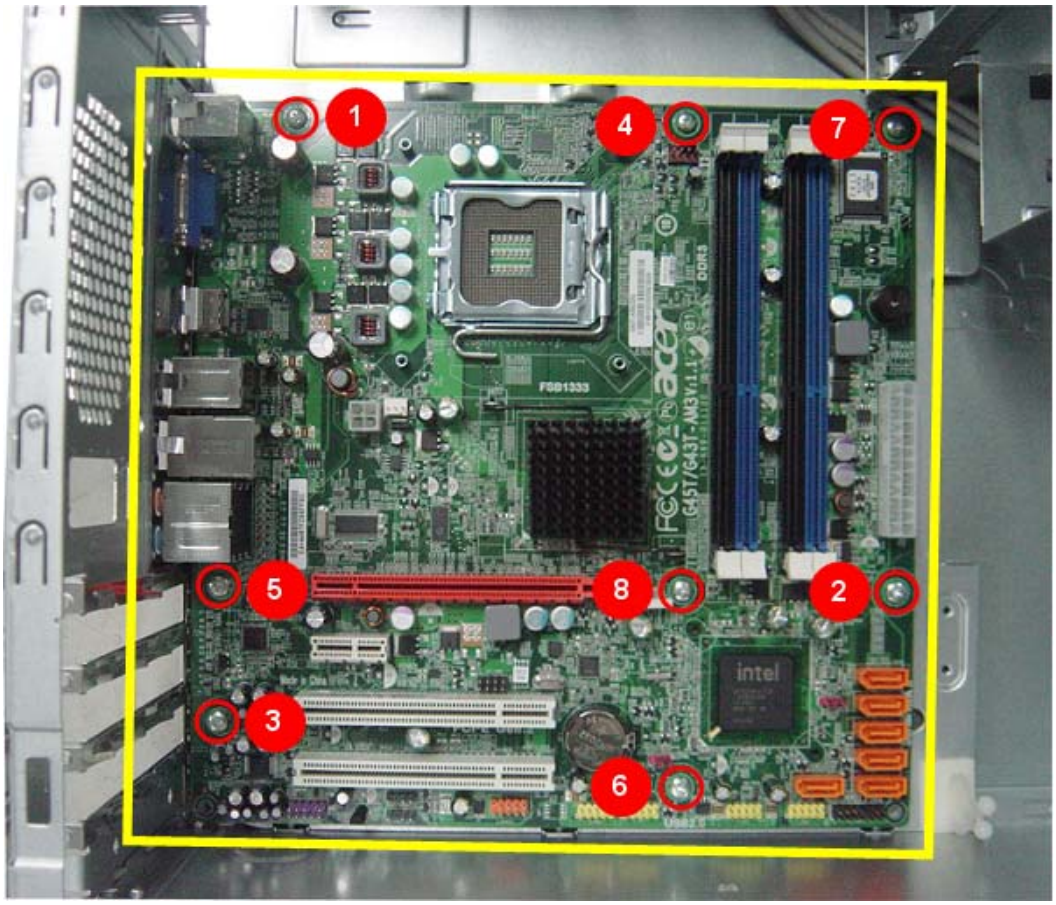
Downloaded from www.Manualslib.com manuals search engine

Removing the Mainboard

1. Disconnect the power switch, top USB, and top audio cables from the mainboard.



2. Remove the eight screws that secure the mainboard to the chassis.



Note: Circuit boards >10 cm² has been highlighted with the yellow rectangle as above image shows.

Please detach the Circuit boards and follow local regulations for disposal.

System Troubleshooting

This chapter provides instructions on how to troubleshoot system hardware problems.

Hardware Diagnostic Procedure

IMPORTANT: The diagnostic tests described in this chapter are only intended to test Acer products. Non-Acer products, prototype cards, or modified options can give false errors and invalid system responses.

1. Obtain the failing symptoms in as much detail as possible.
2. Verify the symptoms by attempting to recreate the failure by running the diagnostic tests or repeating thesame operation.
3. Refer to “Power System check” and “Beep Codes” to determine which corrective action to perform.

Downloaded from www.Manualslib.com manuals search engine

System Check Procedures

Power System Check

If the system will power on, skip this section. Refer to System External Inspection.

If the system will not power on, do the following:

- Check if the power cable is properly connected to the system and AC source.
- Check if the voltage selector switchis set to the correct voltage setting.

System External Inspection

1. Inspect the LED indicators on the front panel, which can indicate the malfunction.
2. Make sure that air flow is not blocked.
3. Make sure nothing in the system is making contact that could short out power.
4. If the problem is not evident, continue with System Internal Inspection.

System Internal Inspection

1. Turn off the system and all the peripherals connected to it.
2. Unplug the power cord from the power outlets.
3. Unplug the power cord from the system.
4. Unplug all peripheral cables from the system.
5. Place the system unit on a flat, stable surface.
6. Remove the system covers.For instructions on removing system covers, refer to “System Disassembly”.
7. Verify that components are properly seated.
8. Verify that all cable connectors inside the system are firmly and correctly attached to their appropriate connectors.
9. Verify that all components are Acer-qualified and supported.
10. Replace the system covers.
11. Power on the system.
12. If the problem with the system is not evident, you can try viewing the POST messages and BIOS event logs during the system startup.

Downloaded from www.Manualslib.com manuals search engine

Beep Codes

Beep codes are used by the BIOS to indicate a serious or fatal error to the end user. Beep codes are used when an error occurs before the system video has been initialized. Beep codes will be generated by the system board speaker, commonly referred to as the PC speaker.

AMIBIOS displays the checkpoints in the bottom right corner of the screen during POST. This display method is limited, since it only displays checkpoints that occur after the video card has been activated.

Not all computers using AMIBIOS enable this feature. In most cases, a checkpoint card is the best tool for viewing AMIBIOS checkpoints.

Beep Symptom	Cause and Description
One short beep	System is ready. System is OK.
Continuous one long beep	Memory not installed or memory error.
One long beep and two short beeps then repeat.	VGA not installed or VGA error. Graphics card error/not installed, graphics card memory error or graphics card BIOS checksum error.
One long beep then two short beep	BIOS damaged. BIOS is damaged, BIOS POST jumps to Boot Block to execute the default procedures.
Two short beeps	CMOS damaged. CMOS checksum error or CMOS battery loss occurs.

Downloaded from www.Manualslib.com manuals search engine

Checkpoints

A checkpoint is either a byte or word value output to I/O port 80h.The BIOS outputs checkpoints throughout bootblock and Power-On Self Test (POST) to indicate the task the system is currently executing. Checkpoint sare very useful in aiding software developers or technicians in debugging problems that occur during the pre-boot process.

Viewing BIOS checkpoints

Viewing all checkpoints generated by the BIOS requires acheckpoint card, also referred to as a POST card or POST diagnostic card. These are ISA or PCI add-in cards that show the value of I/O port 80h on a LED display. Checkpoints may appear on the bottom right corner of the screen during POST. This display method islimited, since it only displays checkpoints thatoccur after the video card has been activated.

Bootblock Initialization Code Checkpoints

The Bootblock initialization code sets up the chipset,memory, and other components before system memory is available. The following table describes the type of checkpoints that may occur during the bootblock initialization portion of the BIOS.

NOTE: Please note that checkpoints may differ between different platforms based on system configuration.Checkpoints may change due to vendor requirements,system chipset or option ROMs from add-in PCI devices.

Checkpoint	Description
Before D0	If boot block debugger is enabled, CPU cache-as-RAM functionality is enabled at this point. Stack will be enabled from this point.
D0	Early Boot Strap Processor (BSP) initialization like microcode update, frequency and other CPU critical initialization. Early chipset initialization is done.
D1	Early super I/O initialization is done including RTC and keyboard controller. Serial port is enabled at this point if needed for debugging. NMI is disabled. Perform keyboard controller BAT test. Save power-on CPUID value in scratch CMOS. Go to flat mode with 4GB limit and GA20 enabled.
D2	Verify the boot block checksum. System will hang here if checksum is bad.
D3	Disable CACHE before memory detection. Execute full memory sizing module. If memory sizing module not executed, start memory refresh and do memory sizing in Boot block code. Do additional chipset initialization. Re-enable CACHE. Verify that flat mode is enabled.
D4	Test base 512KB memory. Adjust policies and cache first 8MB. Set stack.
D5	Bootblock code is copied from ROM to lower system memory and control is given to it. BIOS now executes out of RAM. Copies compressed boot block code to memory in right segments. Copies BIOS from ROM to RAM for faster access. Performs main BIOS checksum and updates recovery status accordingly.
D6	Both key sequence and OEM specific method is checked to determine if BIOSrecovery is forced. Main BIOS checksum is tested. If BIOS recovery is necessary,control flows to checkpoint E0. See Bootblock Recovery Code Checkpoints sectionfor more information.
D7	Restore CPUID value back into register. The Bootblock-Runtime interface module is moved to system memory and control is given to it. Determine whether to execute serial flash.
D8	The Runtime module is uncompressed into memory. CPUID information is stored in memory.
D9	Store the Uncompressed pointer for future use in PMM. Copying Main BIOS into memory. Leaves all RAM below 1MB Read-Write including E000 and F000 shadow areas but closing SMRAM.

Downloaded from www.Manualslib.com manuals search engine

Checkpoint	Description
DA	Restore CPUID value back into register. Give control to BIOS POST (ExecutePOSTKernel). See POST Code Checkpoints section of document for more information.
DC	System is waking from ACPI S3 state.
E1-E8 EC-EE	OEM memory detection/configuration error. This range is reserved for chipset vendors & system manufacturers. The error associated with this value may be different from one platform to the next.

Downloaded from www.Manualslib.com manuals search engine

Bootblock Recovery Code Checkpoints

The Bootblock recovery code gets control when the BIOS determines that a BIOS recovery needs to occur because the user has forced the update or the BIOS checksum is corrupt. The following table describes the type of checkpoints that may occur during the Bootblock recovery portion of the BIOS.

NOTE: Checkpoints may differ between different platforms based on system configuration. Checkpoints maychange due to vendor requirements, system chipset or option ROMs from add-in PCI devices.

Checkpoint	Description
E0	Initialize the floppy controller in the super I/O. Some interrupt vectors are initialized. DMA controller is initialized. 8259 interrupt controller is initialized. L1 cache is enabled.
E9	Set up floppy controller and data. Attempt to read from floppy.
EA	Enable ATAPI hardware. Attempt to read from ARMD and ATAPI CDROM.
EB	Disable ATAPI hardware. Jump back to checkpoint E9.
EF	Read error occurred on media. Jump back to checkpoint EB.
F0	Search for pre-defined recovery file name in root directory.
F1	Recovery file not found.
F2	Start reading FAT table and analyze FAT to find the clusters occupied by the recovery file.
F3	Start reading the recovery file cluster by cluster.
F5	Disable L1 cache.
FA	Check the validity of the recovery file configuration to the current configuration of the flash part.
FB	Make flash write enabled through chipset and OEM specific method. Detect proper flash part. Verify that the found flash part size equals the recovery file size.
F4	The recovery file size does not equal the found flash part size.
FC	Erase the flash part
FD	Program the flash part.
FF	The flash has been updated successfully. Make flash write disabled. Disable ATAPI hardware. Restore CPUID value back into register. Give control to F000 ROM at F000:FFF0h.

Downloaded from www.Manualslib.com manuals search engine

BIOS Recovery

1. This function only effects when the BIOS BootBlock section is healthy.
2. Allow to execute recovery function media: FDD / USB storage / ODD.
3. The recovery media to support Boot function is unnecessary.
4. Recovery step as follow:
   - **4-1.** Copy the latest BIOS ROM file to the root directory of recovery media.
   - **4-2.** Rename the BIOS ROM file to be "AMIBOOT.ROM".
   - **4-3.** Insert the recovery device to system and then power on the system.
   - **4-4.** Don't do anything during the recovery function to be progress but just only observe the recovery media has been loading or not.
   - **4-5.** If the recovery function run normally, the recovery function will execute 1~3 minutes.
   - **4-6.** The system will auto reboot after the recovery function finished and please enter the setup menu to load default after system reboot.

FRU (Field Replaceable Unit) List

This chapter offers the FRU (Field Replaceable Unit) list in global configuration of the Aspire M3900 desktop computer. Refer to this chapter whenever ordering the parts to repair or for RMA (Return Merchandise Authorization).

NOTES:

- When ordering FRU parts, check the most up-to-date information available on your regional web or channel. For whatever reasons a part number is changed, it will NOT be noted on the printed Service Guide. For Acer authorized service providers, your Acer office may have a different part number code from those given in the FRU list of this printed Service Guide. You MUST use the local FRU list provided by your regional Acer office to order FRU parts for service.
- To scrap or to return the defective parts, follow the local government ordinance or regulations on how to dispose it properly, or follow the rules set by your regional Acer office on how to return it.
- This document will be updated as more information about the FRU list becomes available.
